Documentation Part A-C

How to make this project work.

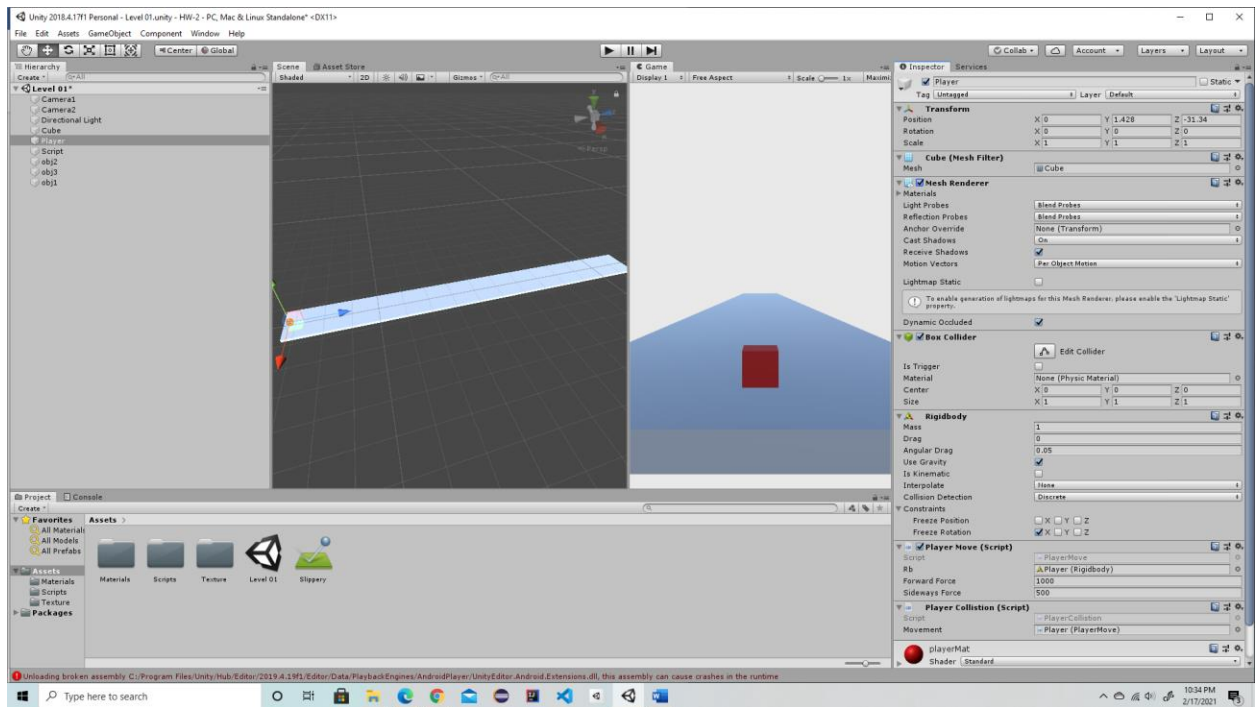

- First you must clone my Git project.
- The link to my project is provided on the top left.
- Once you clone the repo then open the project in the Unity.
- Click on the Level 01 to open the project.
- Once the project appears on your screen then click on play on the top.
- Once the player started to move then you can use A and D to move player left and right.
- Also, you can change the camera view by clicking in letter C.
- The player will change colors if collide with walls.

Details About Part A,B, and C.

- Game objects are the building blocks of a game. They can represent anything and be customized to change almost anything about their appearance. I used cubes and gave them different shapes.
- First, I made a runway out of a cube by changing scale values.

- Then I made a player out of a cube and color it red by using material option. You can move player left and right by using keys A and D.

- After setting up the player and runway I created an object called obj1, obj2, and obj3. These objects are walls which stops the player if you collide.
- After setting up the objects, I setup the camera and position them. There are two camera called camera 1 and camera 2.
- Here is the Camera 1 view

- To change the views of the camera I had to use a script which helps change the view.
- Here is the view of the second camera.

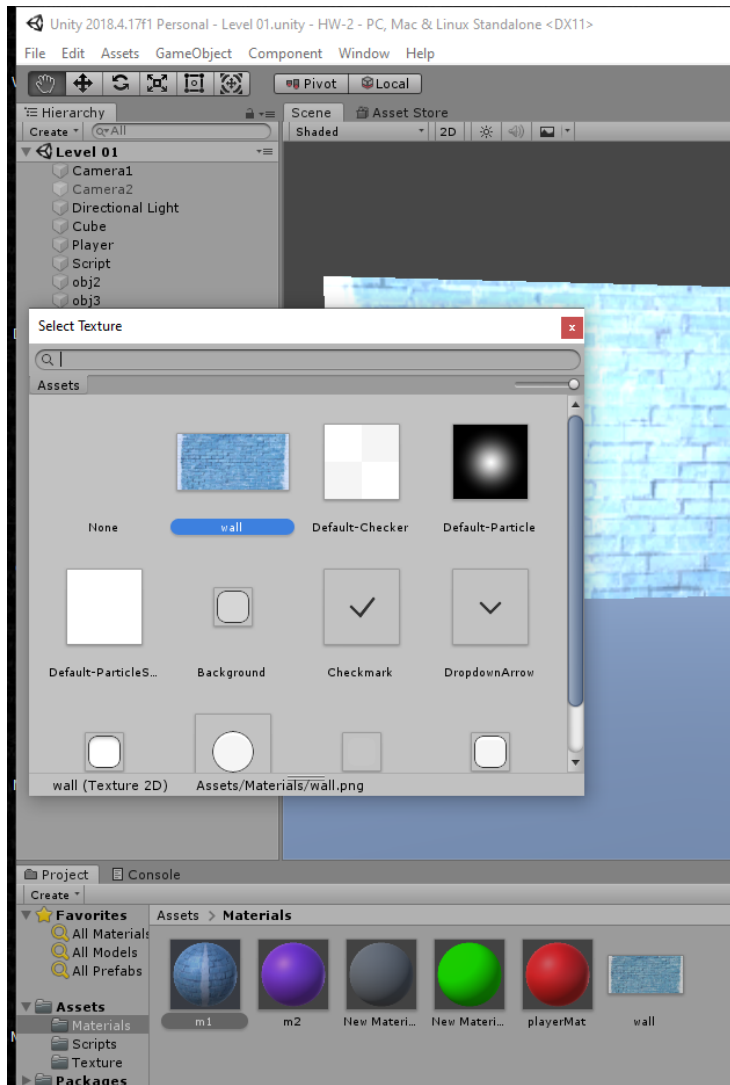

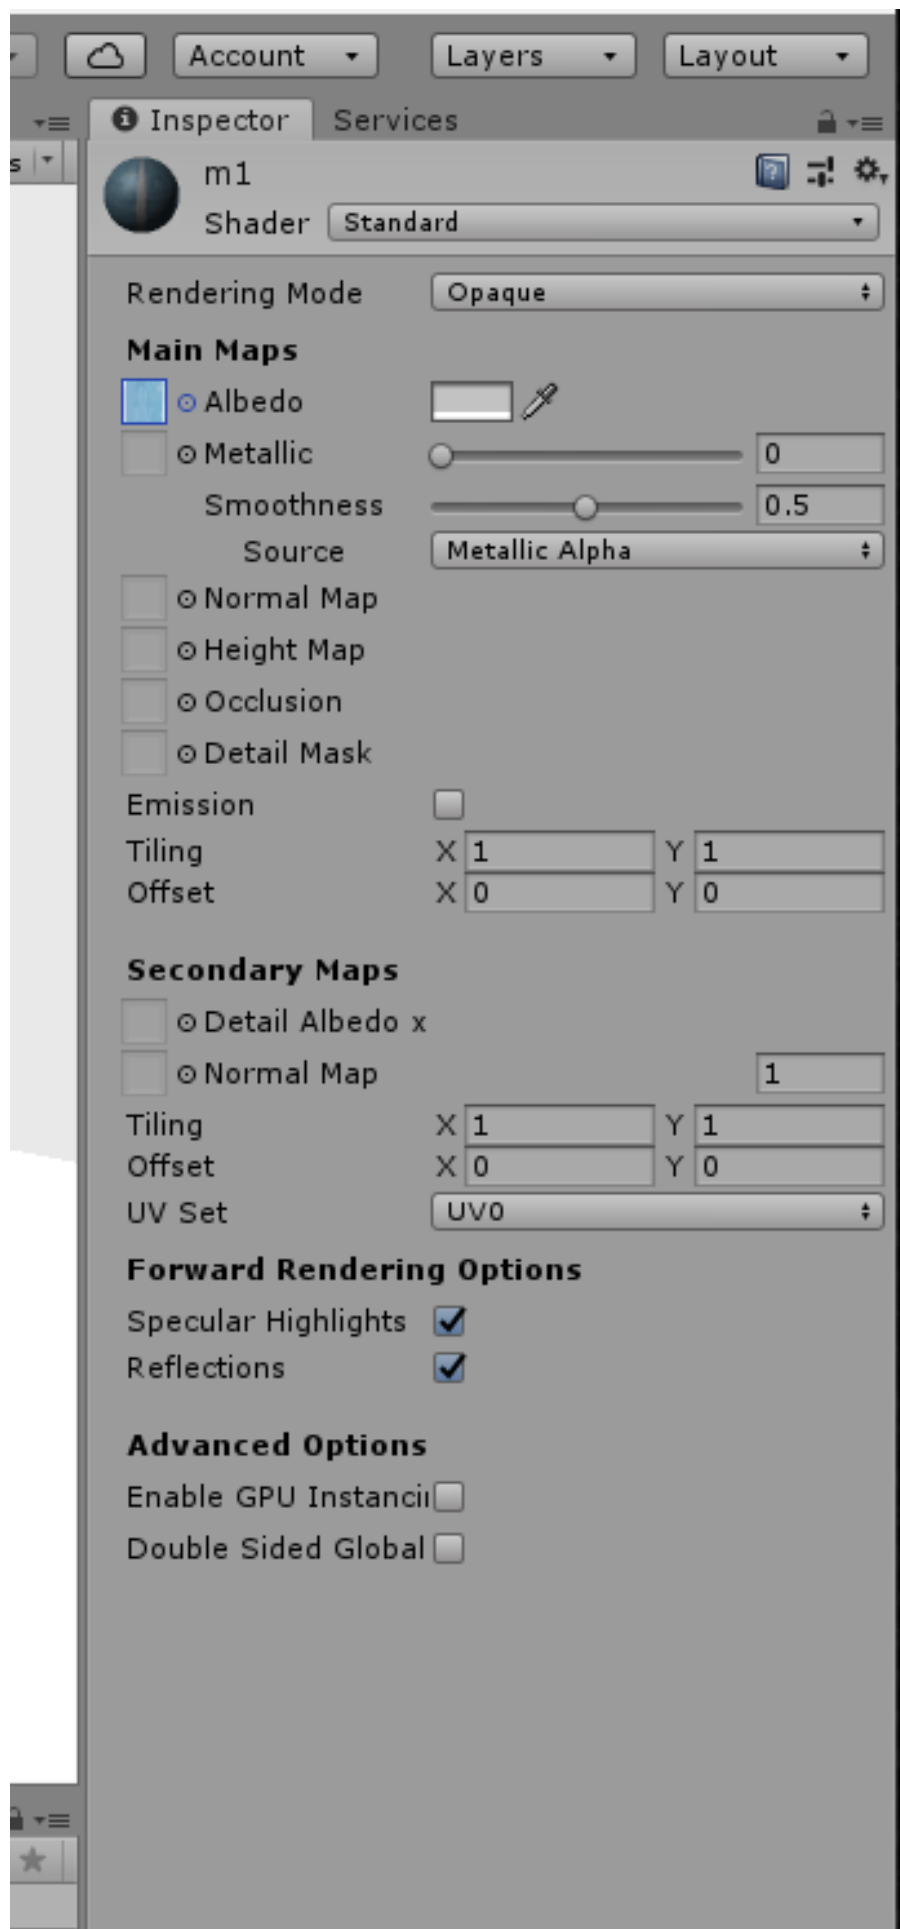

- To switch between cameras, you must press on Key C.
- Here is the screenshot of player colliding with walls,

- To input a texture on the walls I had to pick the texture in the material. As shown in the pic

- The player change color on collisions as shown in the pictures.
- The color is purple before the player hit the ground.

- The color change to green as the player hit the ground

- And the color change to purple when the player collides with the wall.
